<b>Category:</b>		<b>Estimated time:</b>	0.00 hour
<b>Target version:</b>	Release 1.0 paper		
<b>Description</b> We want to perform a performance validation based on simulated data of ctools & GammaLib. Test cases include: <ul style="list-style-type: none"><li>• point source sensitivity curve (showing the 20% increase w/r to classical analysis)</li><li>• point source separation and confusion</li><li>• extended source fitting</li><li>• diffuse emission analysis</li></ul> One idea was to create a fake model of the LMC that includes all these test cases, and that is used for illustration. We may however also use multiple fake models.  We may need to present this to the CTA consortium for validation. This needs to be checked. I tentatively put the Catania meeting as due date.			

History

#1 - 10/29/2015 12:56 AM - Knödlseider Jürgen

- Target version changed from 1.0.0 to Release 1.0 paper

#2 - 02/22/2016 10:12 PM - Knödlseider Jürgen

- Status changed from New to Rejected

- Remaining (hours) set to 0.0

There is a short section about performance validation in the paper, but we dropped the idea of having extensive examples.
