Category:		Estimated time:	0.00 hour
Target version:			

Description

The default values are shown in the method description, hence they do not need to be specified after the parameters. See the attached image.

```
void GEbounds::save ( const GFilename & filename,  
                    const bool & clobber = false,  
                    const std::string & unit = "keV"  
                    ) const
```

Save energy boundaries into FITS file.

Parameters

- [in] **filename** FITS file name.
- [in] **clobber** Overwrite any existing file? (default: false)
- [in] **unit** Energy unit (default: "keV")

Saves energy boundaries into a FITS file. If a file with the given `filename` does not yet exist it will be created, otherwise the method opens the existing file.

The method will append a binary FITS table containing the energy boundaries to the FITS file. The extension name can be specified as part of the `filename`. For example the `filename`

```
myfile.fits[ENERGY BOUNDARIES]
```

will save the energy boundaries in the extension "*ENERGY BOUNDARIES*" of the *myfile.fits* file
