

ctools - Bug #1870

TS value of large components

10/06/2016 03:34 PM - Mayer Michael

Status:	New	Start date:	10/06/2016
Priority:	Normal	Due date:	
Assigned To:		% Done:	0%
Category:		Estimated time:	0.00 hour
Target version:			
Description I recently made the test in simulating a few hundred hours of HESS data (only background) and analysing them with background and a large source in the FoV. Weirdly, the large component yields a TS value around ~100 for the unbinned analysis and ~10 for the stacked analysis. I hope to be able to provide a test case for CTA as well.			

History

- Target version set to 1.2.0

#2 - 10/06/2016 05:22 PM - Knödlseider Jürgen

A test case would indeed be good. I guess large means spatially large? How large was the component?

Maybe some issue with the Npred computation.

Did the ctlike fit converge easily or does the log file indicate issues?

#3 - 10/06/2016 05:26 PM - Mayer Michael

The component was about half the size of the FoV (maybe even extending across and the log-file didnt indicate any issues (no warnings whatsoever). I will try to reproduce this problem with a similar set of pointings for CTA IRFs. Then we might be able to track it down more easily.

I was wondering how the ctlike fit went. Did the fit stall? Or had any other convergence issues? How many iterations did you need?
