

GammaLib - Action #3919

Reproduce Werner Collmar's Crab data

12/02/2021 09:15 PM - Knödlseider Jürgen

Status:	Closed	Start date:	12/02/2021
Priority:	Normal	Due date:	
Assigned To:	Knödlseider Jürgen	% Done:	100%
Category:		Estimated time:	0.00 hour
Target version:	2.0.0		
Description			
The GammaLib code should reproduce the DRIs derived by Werner Collmar for VP 221 as accurate as possible.			
Here is a summary of the SKYDR3 runs that Werner Collmar used to derive the data:			
--- Summary File fuer DREs von VP 221 (erstellt Dez. 2018) ----

History

#1 - 12/02/2021 09:59 PM - Knödseder Jürgen

Here the time intervals of the different files:

Source	TJD start	Tics start	TJD stop	Tics stop	Comment
SKYDR3	9120	469767168	9131	433484991	
m21899_evp.fits header	9120	489600000	9131	440200000	
m21899_evp.fits events	9120	489602484	9131	433429992	
vp0221_0_tim.fits	9120	489602484	9131	433429992	Times shown by GCOMEventList::print() and GCOMTim::print()
m14033_tim.fits	9120	469736000	9131	440200000	
OAD header	9120	0	9131	673477823	
OAD superpackets	9120	0	9131	673346752	Times shown by GCOMOads::print()
GammaLib DRE	9120	489690112	9131	673477823	
GammaLib DRG	9120	489690112	9131	673477823	

The SKYDR3 validity intervals are set from the start of the first OAD and the stop of the last OAD superpacket that is used:

```

C      set the start and end validity interval
      IF(INIT.EQ.1) THEN
        INIT=0
        VALSTA(1)=OATSRT(1)
        VALSTA(2)=OATSRT(2)

```

```

        VALEND(1)=OATEND(1)
        VALEND(2)=OATEND(2)
    ELSE
        VALEND(1)=OATEND(1)
        VALEND(2)=OATEND(2)
C        avoid ticks > 1 day
        IF(VALEND(2).GT.691 199 999)VALEND(2)=691 199 999
    ENDIF

```

with

```

OATEND(1)=CURTIM(1)
OATEND(2)=CURTIM(2) + 131071

```

The GammaLib DRE and DRG times are set by the GCOMDri::use_superpacket() method and reflect the start time of the first and the stop time of the last superpacket that is used, hence the times should be equivalent to those of SKYDR3 if the same OAD files are used.

The SKYDR3 start time corresponds to row 2132 of m22366_oad.fits, while the stop time corresponds to row 2152 of m22387_oad.fits, hence in principle the same OAD records are accessible to GammaLib. The method GCOMOads::read() sets the OAD stop time in the same manner as SKYDR3, hence in principle identical times should be achievable. It is possible a difference in the TIM that can explain the difference.

#2 - 12/02/2021 10:06 PM - Knödlseider Jürgen

Using m14033_tim.fits instead of the GammaLib database TIM produces the exact same start and stop times. However it turns out that the number of superpackets read is smaller than for the SKYDR3 run, and that the OAD file for TJD 9125 is missing.

After Werner sent me the missing OAD dataset I reprocessed the data with the full list of OAD files.

Result	SKYDR3	GammaLib
Number of superpackets read	36973	38162
Number of superpackets used	30001	29901
0.75-1 MeV events accepted	19357	19357
1-3 MeV events accepted	130624	130627
3-10 MeV events accepted	66908	66922
10-33 MeV events accepted	8825	12299
Start	9120:469767168	9120:469767168
Stop	9131:433484991	9131:433484991

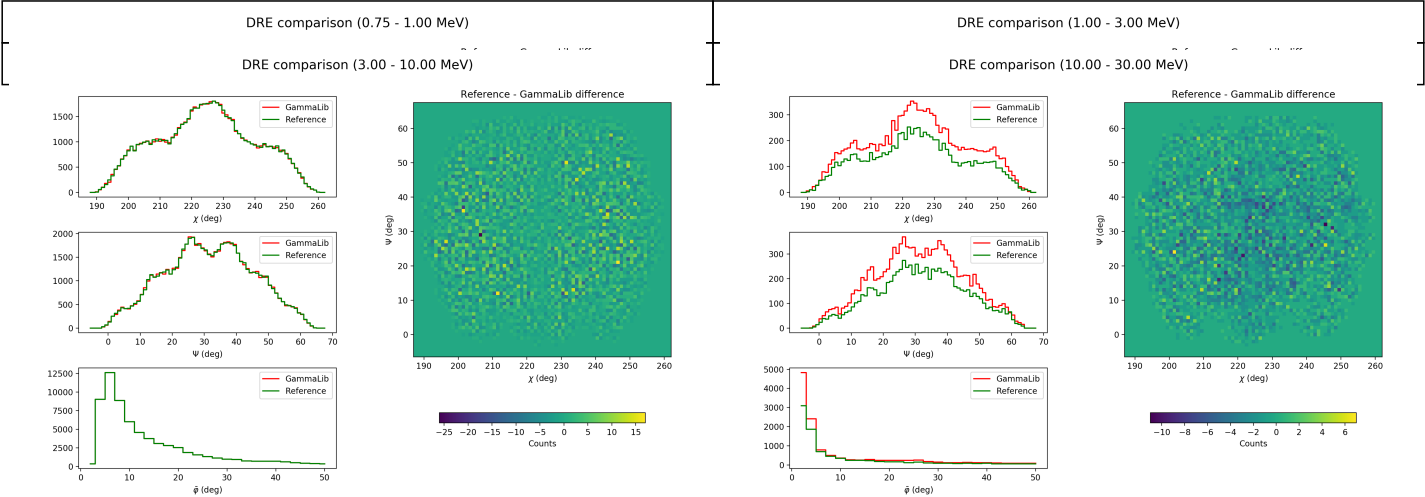

An initial comparison of the SKYDR3 and GammaLib DRIs showed some structure that indicated some difference in the WCS projection between the DRIs. Reproducing the coordinate transformations in SKYDR3 and GammaLib using the script check_dri_projection.py confirmed that the script dri2fits.py that I used to add WCS projection information to the FITS header was not correct. After correcting the FITS headers (and after replicating the same logic in check_dri_projection.py) the script produced the result below. Each row corresponds to one event. Columns with CO correspond to

COMPASS (i.e. SKYDR3), columns with GA to GammaLib. The first step of columns show the X/Y pixel index for both code followed by the difference. Pixel indices are now identical. The second set of columns shows the Galactic longitude and latitude of the events, also here the results are very close. Note that while GammaLib exploits directly the Galactic longitude and latitude information in the EVP file, SKYDR3 performs coordinate transformations, using the event's theta and phi angles.

* Check DRI projection *

Finally the plots below show a comparison of the DREs for the four energy bands. Since the projects of the DREs are not identical I did some random resampling of the events into the same projection, which of course can not reproduce an identity. Nevertheless the agreement is very satisfactory. Only the 10-30 MeV band shows a significant difference, which comes from the different ToF selections used by Werner and myself.

- Status changed from New to In Progress
- % Done changed from 0 to 20

Since the OAD for TJD 9125 is missing I moved to the second dataset that Werner Collmar sent. This is a Crab observation performed during VP 0724.5.

The plot below shows a comparison of the DRG computed using GammaLib (red) with the DRG computed using SKYDR3. Obviously, the differences are tiny. Summing over Werner's DRG gives 9325, while summing over the GammaLib DRG gives 9331, hence a difference of 0.06%!

#6 - 12/04/2021 01:52 PM - Knödlseider Jürgen

- Status changed from *In Progress* to *Closed*
- % Done changed from 20 to 100

The above examples show that the SKYDR3 DRIs for the Crab are well reproduced by GammaLib once the same input data are specified. I therefore close this issue now.
