Description

The equation to use is at the bottom of

https://people.math.gatech.edu/~ecroot/3225/chisguare.pdf

In this equation *a* is the TS value that corresponds to a given significance level. Since *a* should be the outcome, the equation can only be solved iteratively.

To obtained the Probability on the left hand side of the equation, a Gaussian needs to be integrated over the interval [-sigma,+sigma], and the probability to be used is 1 - the integral.

The other parameters to use are alpha = 1/2 and k which is the number of degrees of freedom, see for example https://programmathicallv.com/chi-square-distribution-and-degrees-of-freedom/.

For 2 degrees of freedom the equation simplifies to

P(Chi2 > TS) = exp(-E/2.0)

hence

 $TS = -2 \ln(P)$

Sigma	P	TS
1	1-0.6827	2.2958
2	1-0.9545	6.1801
3	1-0.9973	11.8290
