Target version:	2.1.0		
Description <p>So far the GModelSpatial::flux method only works for circular regions and models. The method should be generalised so that it works for any kind of regions and models. This is probably best achieve by creating a model map for the spatial model and integrating the model map using the GSkyMap::flux() method, like in GModelSpatialDiffuseMap::flux():</p> <pre>// Compute flux in sky region double flux = m_map.flux(region) * m_value.value();</pre>			

History

- Status changed from New to Pull request
- % Done changed from 0 to 90

I implemented a scheme where an integration over the model bounding circle is done, checking for each evaluation whether the corresponding sky direction is contained within the specified region.
